Otter works by altering the metadata of the notebook. The notebook creator first indicates which cells should be included in the PDF (both Markdown and code cells) by adding `<!-- BEGIN QUESTION -->` and `<!-- END QUESTION -->` to those cells. In order for the tags to work, they must be on their own lines so, for example, the tags in this paragraph would not include anything.

TODO: add the correct tag to the success and danger cells above to include them in the pdf.

TODO2: Change the size of the Venn diagram image above to 400px by 400px, and include it in the pdf.

0.1 Pagebreaks

To make it easier to use Gradescope with assignments, Otter will also include pagebreaks between exported sections so that templating can be made easier. In other words, areas between `<!-- #newpage -->` and `<!-- BEGIN QUESTION -->` are excluded from the exported pdf.
